COASTAL ENVIRONMENTAL SYSTEMS

Datalogger Now Available with NWS Algorithms!

Seattle, WA: The ZENO[®]-3200, Coastal's data logger/data acquisition system is now available with National Weather Service (NWS) algorithms to all customers for processing meteorological data. Previously, these algorithms have been built into ZENOSOFT[™] program configuration files, as required for the following systems:

- METMF(R) for the US Marines,
- Fog Forecasting Network for the US Navy Antarctica,
- Precision Digital Barometer (PDB-1) for the NWS,
- Stand Alone Weather Station (SAWS) for the FAA, and
- RSOIS for the National Weather Service.

You can now purchase a standard ZENO[®] with these algorithms built-in. ZENO[®] 's functioning does not change, and you can still process data in other ways – exclusive of these algorithms – but now you have a choice!

The algorithms have been independently approved by the US Navy, the NWS, and the FAA.
